

CRITICALLY READING THE THEORY AND METHODS OF ARCHAEOLOGY

AN INTRODUCTORY
GUIDE

GUY GIBBON

ARCHAEOLOGICAL THEORY / ARCHAEOLOGICAL METHODS

"This little book packs a punch! We have come to expect clear arguments and cogent logic from Guy Gibbon's work, but here he not only gives us the tools to evaluate the clarity, validity, and cogency of archaeological literature, but also employs them to analyze examples of potential arguments. This book should be required reading for any archaeologist. I am certain it will become a well-thumbed volume on my bookshelf."

—Peter Peregrine, PhD, Lawrence University

"The most invaluable lesson I learned at university was to be skeptical of what I read and to think for myself. Gibbon's stimulating book, *Critically Reading the Theory and Methods of Archaeology*, encourages readers to read critically, challenge arguments, and not accept things at face value, and it is to be applauded and welcomed for doing so. Our discipline will only progress through the rebuttal of fixed ideas, entrenched views, and erroneous dogmas, of which there are many in archaeology."

—Paul G. Bahn, coauthor of *Archaeology: Theories, Methods, and Practice*

"Gibbon has produced a powerful text for courses that aim to teach disciplinary writing and thinking and for courses in archaeological writing and archaeological theory. *Critically Reading the Theory and Methods of Archaeology* fosters thinking about archaeology as a holistic discipline and is a valuable resource for teaching archaeology students to read and think critically."

—Mary C. Beaudry, Boston University

Critically Reading the Theory and Methods of Archaeology stands out as the most thorough and practical guide to the essential critical reading and writing skills that all archaeological students, instructors, and practitioners should have. It provides priceless insight for the here and now of the theory and methods of archaeology classes and for a lifetime of reading, learning, teaching, and writing. Chapters focus on rigorous reasoning skills, types of arguments, the main research orientations in archaeology, the basic procedural framework that underlies all schools of archaeology, and issues in archaeology raised by skeptical postmodernists.

GUY GIBBON is professor emeritus at the University of Minnesota. He is the author of a number of books, including *Anthropological Archaeology*, *Explanation in Archaeology*, and *The Sioux*.

CONTENTS

Introduction 1

Part I: Foundations 5

CHAPTER 1

What Kind of Archaeology Is It? 7

Descriptions of the aim of archaeology ▪ Two missteps: flatland modernism and skeptical postmodernism ▪ The tasks of archaeology from a four quadrants perspective ▪ Cultural resource management ▪ What *is* the aim of archaeology?

CHAPTER 2

What Kind of Investigation Is It? 17

The research cycle ▪ Investigations within the research cycle ▪ Additional considerations

CHAPTER 3

What Are the Issue and the Claim? 27

What is the issue? ▪ What is the claim? ▪ Thinking critically about questions ▪ What is the historical context of the issue and claim?

CHAPTER 4

What Is the Argument? 35

Is there an argument? ▪ Why is it necessary to evaluate arguments? ▪ Is it a good argument? ▪ A checklist for evaluating arguments ▪ Evaluating arguments fairly

CHAPTER 5

What Are the Assumptions? 45

Types of assumptions and their function in arguments ▪ Hints for locating assumptions ▪ Research programs: an introduction

CHAPTER 6

Is the Writing Clear? 55

Organization and style ▪ Ambiguous words and phrases ▪ Spotting ambiguities ▪ Clarifying ambiguity ▪ Vague claims and puzzling comparisons ▪ Unfamiliar words and phrases

CHAPTER 7

Are (Deceptive) Rhetorical Devices Used? 67

Euphemisms and dysphemisms ▪ Persuasive comparisons, definitions, and explanations ▪ Stereotypes, innuendo, and loaded questions ▪ Weasellers, downplayers, and sarcasm ▪ Hyperbole and proof surrogates

CHAPTER 8

Is There a Fallacy in the Reasoning? 75

Errors in reasoning ▪ Fallacies that violate the relevance criterion ▪ Fallacies that violate the acceptability criterion ▪ Fallacies that violate the sufficiency criterion ▪ Fallacies that violate the rebuttal criterion

CHAPTER 9

Are There Skeptical Postmodern Themes in the Argument? 85

Unmasking the foundations of science ▪ The influence of postmodernism in scholarly research ▪ Six responses to skeptical postmodernism

Part II: From Observations to Population Estimates 95

CHAPTER 10

Are Facts Clearly Distinguished from Opinions and Other Claims? 97

How factual are factual claims? ▪ The credibility of evidence ▪ Recognizing factual claims in your reading ▪ Major kinds of evidence ▪ Intuition, authority, and testimonials ▪ Personal observation, case studies, and analogies ▪ Research studies as evidence

CHAPTER 11

How Are the Observations Summarized? 107

What are data? ■ Tabular and pictorial methods of displaying data ■
Measures of position: the average ■ Measures of variability: the spread

CHAPTER 12

Is There an Inductive Argument? 119

Deductive and inductive arguments ■ Inductive generalizations ■
Analogical arguments ■ Fallacies of inductive reasoning

CHAPTER 13

Is There a Population Estimate from a Sample? 129

Statistical inference ■ Hypothesis testing ■ An example
of formal hypothesis testing

Part III: Interpreting the Archaeological Record 139

CHAPTER 14

Is There a Theory in My Reading? 141

Making sense of the archaeological record ■ Two views
of the structure of a theory ■ The empiricism–social
constructivism–scientific realism dispute

CHAPTER 15

Which Research Program Is My Reading an Example Of? 151

Trait-centered archaeology ■ Systems-centered archaeology ■
Agency-centered archaeology ■ Integral archaeology ■ Must
archaeologists work within a single research program?

CHAPTER 16

Is an Explanation Offered? 161

Identifying explanations ■ Three targets of explanation in
archaeology ■ Argument to the best explanation ■ Common
errors in framing explanations ■ Using an analogy to explain

CHAPTER 17

Is There a Causal Argument? 171

Causation among specific events ■ Common mistakes in causal
reasoning ■ Causation in populations ■ Use of anecdotal evidence
in causal reasoning

Part IV: Evaluating Interpretations of the Archaeological Record 181

CHAPTER 18

Are Deductively Valid Conclusions Drawn? 183

Deductive versus inductive strength of arguments ■ Some common patterns of deductive arguments ■ An example of deductive reasoning in archaeology

CHAPTER 19

Are Concepts Given Archaeological Interpretations? 193

Preparing predictions for testing ■ The reliability and validity of indicators ■ Evaluating archaeological indicators

CHAPTER 20

Are the Conclusions Reasonable? 203

Are the conclusions true? ■ Assessing the truth value of conclusions: a four-step approach ■ Common errors in drawing conclusions ■ Remember: The research cycle is a cycle

About the Author 245

Critically Reading the Theory and Methods of Archaeology: An Introductory Guide

Guy Gibbon. 2014. AltaMira Press, viii + 245pp., 5 figures, 2 tables, endnotes, references. \$95.00 (Hardback), \$38.00 (Paper), \$37.99 (eBook).

Reviewed by Julie Zimmermann Holt, Department of Anthropology, Southern Illinois University Edwardsville.

Gibbon's main goal with this book is clearly indicated by his title: he wants readers to think critically when reading archaeological texts. He suggests that his book is appropriate for undergraduates, graduate students, nonprofessionals, and also professional archaeologists. He further suggests that students engaged in thesis writing and also professional archaeologists might find the book useful in helping them write more clearly and coherently. I think Gibbon succeeds with these goals, and I agree that both students and professionals will benefit from reading his book.

The book is divided into four parts and twenty chapters, which Gibbon says can be read in any order. Part I (Chapters 1–9), titled “*Foundations*,” introduces different kinds and goals of archaeology, the research cycle, informal logic, and reading strategies. Part II (Chapters 10–13) is titled “*From Observations to Population Estimates*” and offers a very succinct crash course in statistics, or, to be more accurate, a crash course in critically reading statistics, tables, and charts. Part III (Chapters 14–17) is titled “*Interpreting the Archaeological Record*,” and offers additional discussion of the research cycle, research programs in archaeology, and informal logic. Part IV (Chapters 18–20), titled “*Evaluating Interpretations of the Archaeological Record*,” offers further discussion of how to evaluate archaeological conclusions and interpretations.

Gibbon's writing is refreshingly clear: he practices what he preaches! I think undergraduates will find his writing accessible, and will also appreciate the brevity of the chapters, as I did. Students today are used to sound bites, and I must admit that my own attention span is not what it used to be. Another feature of Gibbon's writing that facilitates reading is his use of endnotes rather than in-text citations. I found the notes at the end of the book interesting, but I suspect most undergraduates would skip them unless writing a paper on one of the topics Gibbon covers. Since “*Reasoning and Argumentation*” is a required course at my university, I think most of my students would find the discussions of informal logic familiar, and would probably groan at having to read chapters dedicated to rhetorical devices (Chapter 7), fallacies in reasoning (Chapter 8), etc. Nevertheless, I think they would benefit from thinking about logic and argumentation with specific reference to archaeology, and taught by an archaeologist rather than a philosophy professor. I think my students would also groan at the chapters on statistical analysis. However they would benefit from this presentation as well, most especially since they are *not* required to take a course in statistics.

Book Review

My students already groan loudly when required to read about archaeological “theory,” but these are the discussions in the book that I found most thought provoking. In Chapter 1, Gibbon begins by offering a brief description and critique of different types of archaeology. Here he offers a contrast between the extremes of “flatland modernism” and “skeptical postmodernism,” which he suggests are both “missteps.” Gibbon cites the philosopher Ken Wilber, arguing that rather than simply study humans from the opposing stances of either “scientific materialism” or “skeptical postmodernism,” archaeologists would more productively study humans from four different, complementary perspectives. These are nicely summarized in Figure 1.1, and include “exterior-individual,” “exterior-collective,” “interior-collective”, and “interior-individual” quadrants, where *individual* refers to the individual (person, artifact, etc.) and *collective* refers to the group (society, tool kits, etc.), and *interior* is subjective (or perhaps *emic*) whereas *exterior* is objective (or perhaps *etic*). Or, to ponder these quadrants in terms more familiar to archaeologists, respectively they might roughly compare with infrastructure, structure, superstructure, and the mind of the individual. Although Gibbon argues that each of these quadrants is equally important, he also admits the difficulty for archaeologists in developing “testable knowledge about the interior thoughts of individuals and the cultural understandings they share” (p. 14).

Following Gibbon’s advice to think about an author’s word choice, I would note that he clearly advocates hypothesis-testing, but nowhere did I see mention of the hermeneutic circle or discussion of hermeneutics. Throughout the book, Gibbon is in fact presenting a philosophy of science as he discusses the research cycle, the nature of observation, objectivity, credibility and kinds of evidence, deductive and inductive arguments, and the like. However, while he is clearly a proponent of scientific reasoning, he also concludes that “there is no choice but to accept a skeptical postmodern position” (p. 88).

In Chapter 1, when he first discusses modernism and postmodernism, Gibbon does not use the terms “*processualism*” or “*postprocessualism*.” My curiosity piqued by his avoidance of these terms, I found that the phrase “*processual archaeology*” appears in the index, but the phrase “*postprocessual archaeology*” does not. However, in the discussion of *Research Programs* in Chapter 15, Gibbon explicitly discusses both processual and postprocessual archaeologies, the former characterized as “systems-centered” archaeology and the latter offered as an example of “agency-centered research programs.” In his endnotes, Gibbon argues, “Postprocessualists generally agree that the term ‘postprocessual’ is inadequate, for it does not describe what their program is about.... In contrast to the other research programs reviewed here, there is a very diverse array of viewpoints in agency-centered archaeology” (p. 225). The other research programs reviewed by Gibbon in Chapter 15 are “*trait-centered archaeology*” (i.e., pre-processual archaeology) and “*integral archaeology*” (i.e., post-postprocessualism, if you will). Gibbons discusses these four research programs in historical order (*trait-centered*, *systems-centered*, *agency-centered*, and *integral archaeology*), and he notes that each research program offers a critique of the one that came before. He states that *integral archaeology* considers “all four quadrants [exterior-individual, exterior-collective, interior-collective, and interior-individual] without privileging any one of them” (p. 157). Since he notes in Chapter 1 that each

Book Review

of these four quadrants is equally important, and since *integral archaeology* is apparently the only research program that considers all four quadrants equally, we might assume that it is superior to the older research programs. However, Gibbon concludes Chapter 15 by suggesting that these successive research programs complement rather than compete with one another. He argues, “a case can be made that the emergence of the research programs reviewed in this chapter were stimulated as much if not more so by changing ideals of science than by growing maturity within the discipline” (p. 159). He somewhat cynically suggests that new research programs emerge as new scholars strive to make a name for themselves, and that newer is not necessarily better.

As I write this, my *Archaeology Method and Theory* students are struggling to write their research papers on a theoretical paradigm in archaeology. I wish I had assigned this book, even though it would make them groan (everything does). Gibbon offers an up-to-date, concise, and readable summary of archaeological theory, informal logic, statistics, and philosophy of science. Undergraduates, graduates, and professionals alike might find that this book will not only make them more critical readers of archaeology, but also better writers of archaeology. That is, Gibbon’s book has the potential to make us better archaeologists.
